

ABSTRACT OF DISCLOSURE

Exposing glittering of a hunter's eyes is prevented by headwear including a wearing portion for being worn on a head of a wearer and a visor projecting from the wearing portion, wherein the visor includes a base member

5 for forming a shape of the visor and the base member has a seeing-through portion. A mesh member, which can be seen through by the hunter when the headwear is worn on the head, is attached to the base member and covers the seeing-through portion. Accordingly, in addition to conventional functions of a cap or hat, the hunter can keep watching animals without exposing glittering of

10 his eyes.
